

NAME

xbacklight - adjust backlight brightness using RandR extension

SYNOPSIS

xbacklight [-help] [-display *display*] [-get] [-set percent] [-inc percent] [-dec percent]

DESCRIPTION

Xbacklight is used to adjust the backlight brightness where supported. It finds all outputs on the X server supporting backlight brightness control and changes them all in the same way.

-get

Print out the current backlight brightness of each output with such a control. The brightness is represented as a percentage of the maximum brightness supported.

-set *percent*

Sets each backlight brightness to the specified level.

-inc *percent*

Increases brightness by the specified amount.

-dec *percent*

Decreases brightness by the specified amount.

-help

Print out a summary of the usage and exit.

-version

Print out the program version and exit.

-time *milliseconds*

Length of time to spend fading the backlight between old and new value. Default is 200.

-steps *number*

Number of steps to take while fading. Default is 20.
