NAME
      xcb_open_font - opens a font

SYNOPSIS
      #include <xcb/xproto.h>

 Request function
      xcb_void_cookie_t **xcb_open_font**(xcb_connection_t *conn*, xcb_font_t *fid*, uint16_t *name_len*, const
            char *name*);

REQUEST ARGUMENTS
      conn   The XCB connection to X11.

      fid   The ID with which you will refer to the font, created by *xcb_generate_id*.

      name_len   Length (in bytes) of *name*.

      name   A pattern describing an X core font.

DESCRIPTION
      Opens any X core font matching the given *name* (for example "-misc-fixed-*").

      Note that X core fonts are deprecated (but still supported) in favor of client-side rendering using Xft.

RETURN VALUE
      Returns an *xcb_void_cookie_t*. Errors (if any) have to be handled in the event loop.

      If you want to handle errors directly with *xcb_request_check* instead, use *xcb_open_font_checked*. See
      xcb-requests(3) for details.

ERRORS
      xcb_name_error_t
                        No font matches the given *name*.
