NAME

xml2-config - script to get information about the installed version of libxml2

SYNOPSIS

xml2-config [--prefix*[=DIR]*] [--libs] [--cflags] [--version] [--help]

DESCRIPTION

xml2-config is a tool that is used to determine the compile and linker flags that should be used to compile and link programs that use *libxml2*.

OPTIONS

xml2-config accepts the following options:

--version Print the currently installed version of *libxml2* on the standard output.

--libs   Print the linker flags that are necessary to link a *libxml2* program. Add --dynamic after --libs to print only shared library linking information.

--cflags   Print the compiler flags that are necessary to compile a *libxml2* program.

--prefix=PREFIX

If specified, use PREFIX instead of the installation prefix that *libxml2* was built with when computing the output for the --cflags and --libs options. This option must be specified before any --libs or --cflags options.
