NAME

ypldap - YP map server using LDAP backend

SYNOPSIS

ypldap [**-dnv**] [**-D** *macro=value*] [**-f** *file*]

DESCRIPTION

ypldap is a daemon providing YP maps using LDAP as a backend. RFC 2307 or similar LDAP schemas can be tied to the different YP maps. **ypldap** has the same role as ypserv(8) and the two daemons are exclusive.

The options are as follows:

-D *macro=value*

    Define *macro* to be set to *value* on the command line. Overrides the definition of *macro* in the configuration file.

-d   Do not daemonize. If this option is specified, **ypldap** will run in the foreground and log to *stderr*.

-f *file*   Specify an alternative configuration file.

-n   Configtest mode. Only check the configuration file for validity.

-v   Produce more verbose output.

FILES

/etc/ypldap.conf   Default **ypldap** configuration file.

SEE ALSO

ypldap.conf(5), ypbind(8)

HISTORY

The **ypldap** program first appeared in OpenBSD 4.4 and then FreeBSD 11.0.

AUTHORS

The **ypldap** program was written by Pierre-Yves Ritschard.
