NAME

zfs-clone - clone snapshot of ZFS dataset

SYNOPSIS

zfs clone [**-p**] [**-o** *property=value*]<?> *snapshot filesystem*|*volume*

DESCRIPTION

See the *Clones* section of zfsconcepts(7) for details. The target dataset can be located anywhere in the ZFS hierarchy, and is created as the same type as the original.

-o property=value

Sets the specified property; see **zfs create** for details.

-p Creates all the non-existing parent datasets. Datasets created in this manner are automatically mounted according to the **mountpoint** property inherited from their parent. If the target filesystem or volume already exists, the operation completes successfully.

EXAMPLES

Example 1: Creating a ZFS Clone

The following command creates a writable file system whose initial contents are the same as *pool/home/bob@yesterday*.

zfs clone pool/home/bob@yesterday pool/clone

Example 2: Promoting a ZFS Clone

The following commands illustrate how to test out changes to a file system, and then replace the original file system with the changed one, using clones, clone promotion, and renaming:

zfs create pool/project/production

populate /pool/project/production with data

zfs snapshot pool/project/production@today

zfs clone pool/project/production@today pool/project/beta

make changes to /pool/project/beta and test them

zfs promote pool/project/beta

zfs rename pool/project/production pool/project/legacy

zfs rename pool/project/beta pool/project/production

once the legacy version is no longer needed, it can be destroyed

zfs destroy pool/project/legacy
