

NAME

zip_register_progress_callback - provide updates during zip_close (obsolete interface)

LIBRARY

libzip (-lzip)

SYNOPSIS

```
#include <zip.h>
```

```
typedef void (*zip_progress_callback_t)(double);
```

```
void
```

```
zip_register_progress_callback(zip_t *archive, zip_progress_callback_t progress_callback);
```

DESCRIPTION

The function **zip_register_progress_callback()** is the obsolete version of **zip_register_progress_callback_with_state(3)**.

The **zip_register_progress_callback()** function registers a callback function *progress_callback* for the zip archive *archive*. This function is called during **zip_close(3)** after every zip archive entry that's completely written to disk. The value is a *double* in the range from 0.0 to 1.0. This can be used to provide progress indicators for user interfaces.

SEE ALSO

libzip(3), zip_close(3)

HISTORY

zip_register_progress_callback() was added in libzip 1.2.0. It was deprecated in libzip 1.3.0, use **zip_register_progress_callback_with_state()** instead.
